A new page is started for each warehouse, creating a separate spool file for each warehouse to enable printing to be distributed to different locations.

Here you can see the quantity on hand and stock value for each product. Stock value has been created by Jacana.

Each product is listed in descending order by stock value but could just as easily be sequenced on any other column.

The warehouse total appears at the top of each page. This is challenging in RPG programming terms but a breeze using Jacana

Products with a margin of less than 50% are highlighted

The profit margin has been calculated for the product line. In addition the stock value is represented as a percentage of the total stock held at the warehouse. The calculations are defined using Jacana and are not held in the database itself
